The time cost of function call is increase with the increasing size of input.

6: Time: $O(n \lg n)$, Space: $O(1)$, constant. The time is the same as merge sort. The space is less than merge sort.

```
7: procedure COMPUTED_VALUE(){
    begin:
        a = first()
        val = impressive_A(a.height)
        a.computed_value = val
        a = next()
    end
}
```

time complexity: $O(1)$
space complexity: $O(n)$

```
8: procedure INSERT(val){
    a, b : STACK
    begin:
        for all n in a
            if n < val
                b.push(n)
        b.push(n)
        for all n in a
            if n > val
                b.push(n)
    return b
}
```

```
end  
}
```

time complexity: $O(1)$, constant
space complexity: $O(n)$

```
procedure REMOVE(val){  
  a, b : STACK  
  begin:  
    for all n in a  
      if n! = val  
        b.push(n)  
    return b  
  end  
}
```

time complexity: $O(1)$, constant
space complexity: $O(n)$

```
9: procedure RSYNC(){  
  n = 1  
  begin:  
    a:= SERVER  
    b:= CLIENT  
    while b(n , n+511) != null  
      if a(n, n+511) != null  
        if a(n, n+511) != b(n, n+511)  
          return n  
    end  
  }  
}
```
